P-values

· Most common measure of "statistical significance"

· Their ubiquity, along with concern over their interpretation and use makes them controversial among statisticians

   - http://warnercnr.colostate.edu/~anderson/thompson1.html

   - Also see *Statistical Evidence: A Likelihood Paradigm* by Richard Royall

   - *Toward Evidence-Based Medical Statistics. 1: The P Value Fallacy* by Steve Goodman

   - The hilariously titled: *The Earth is Round (p < .05)* by Cohen.

· Some positive comments

What is a P-value?

Idea: Suppose nothing is going on - how unusual is it to see the estimate we got?

Approach:

1. Define the hypothetical distribution of a data summary (statistic) when "nothing is going on" (*null hypothesis*)

2. Calculate the summary/statistic with the data we have (*test statistic*)

3. Compare what we calculated to our hypothetical distribution and see if the value is "extreme" (*p-value*)

P-values

- The P-value is the probability under the null hypothesis of obtaining evidence as extreme or more extreme than would be observed by chance alone

- If the P-value is small, then either H_0 is true and we have observed a rare event or H_0 is false

- In our example the T statistic was 0.8.

  - What's the probability of getting a T statistic as large as 0.8?

```
pt(0.8, 15, lower.tail = FALSE)
```

```
## [1] 0.2181
```

- Therefore, the probability of seeing evidence as extreme or more extreme than that actually obtained under H_0 is 0.2181

The attained significance level

- Our test statistic was 2 for $H_0 : \mu_0 = 30$ versus $H_a : \mu > 30$.

- Notice that we rejected the one sided test when $\alpha = 0.05$, would we reject if $\alpha = 0.01$, how about 0.001?

- The smallest value for alpha that you still reject the null hypothesis is called the *attained significance level*

- This is equivalent, but philosophically a little different from, the *P-value*

Notes

- By reporting a P-value the reader can perform the hypothesis test at whatever \alpha level he or she choses

- If the P-value is less than \alpha you reject the null hypothesis

- For two sided hypothesis test, double the smaller of the two one sided hypothesis test Pvalues

Revisiting an earlier example

- Suppose a friend has 8 children, 7 of which are girls and none are twins

- If each gender has an independent 50% probability for each birth, what's the probability of getting 7 or more girls out of 8 births?

```
choose(8, 7) * 0.5^8 + choose(8, 8) * 0.5^8
```

```
## [1] 0.03516
```

```
pbinom(6, size = 8, prob = 0.5, lower.tail = FALSE)
```

```
## [1] 0.03516
```

Poisson example

- Suppose that a hospital has an infection rate of 10 infections per 100 person/days at risk (rate of 0.1) during the last monitoring period.

- Assume that an infection rate of 0.05 is an important benchmark.

- Given the model, could the observed rate being larger than 0.05 be attributed to chance?

- Under H_0: $\lambda = 0.05$ so that $\lambda_0 \, 100 = 5$

- Consider H_a: $\lambda > 0.05$.

```
ppois(9, 5, lower.tail = FALSE)
```

```
## [1] 0.03183
```
